KEY_Practice12_Pandas-Subsetting

July 16, 2019

1 Practice: Subsetting Pandas DataFrames

For this practice, let's use the iris dataset:

```
[4]: # mount Google Drive
from google.colab import drive
drive.mount('/content/gdrive')
path = '/content/gdrive/My Drive/SummerExperience-master/'
```

Drive already mounted at /content/gdrive; to attempt to forcibly remount, call drive.mount("/content/gdrive", force_remount=True).

```
[0]: # import pandas package
import pandas as pd

[0]: # this is where the file is located
filename = path + 'SampleData/iris.csv'
# load the iris dataset into a DataFrame
iris = pd.read_csv(filename)
```

Refamiliarize yourself with the dataset:

```
[7]: # take a look at the beginning iris.head()
```

```
sepal_length sepal_width petal_length petal_width species
[7]:
                5.1
                             3.5
                                           1.4
                                                         0.2 setosa
                4.9
                             3.0
                                           1.4
                                                         0.2 setosa
    1
    2
                4.7
                             3.2
                                           1.3
                                                         0.2 setosa
    3
                4.6
                             3.1
                                           1.5
                                                         0.2 setosa
                5.0
                             3.6
                                           1.4
                                                         0.2 setosa
```

Try subsetting on columns:

```
[8]: # subset the species column

iris['species']
```

```
[8]: 0 setosa
1 setosa
```

```
