KEY_Practice13_Numpy_intro

July 17, 2019

1 Practice with numpy!

Remember: * Numpy provides a bunch of useful tools for performing calculations * You access numpy functions by calling np.function_name

First, import numpy. Remember to use the nickname!

```
[0]: # load numpy
import numpy as np
```

Use numpy to create a list of numbers from 0 through 99. We'll use a function called arange.

```
[0]: # Use np.arrange to generate an array of numbers and assign it to a variable 

⇒called numbers

numbers = np.arange(100)

# print the array to see what it looks like

print(numbers)
```

```
[ 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60 61 62 63 64 65 66 67 68 69 70 71 72 73 74 75 76 77 78 79 80 81 82 83 84 85 86 87 88 89 90 91 92 93 94 95 96 97 98 99]
```

Now use numpy's function called zeros to create another empty array of the same size:

```
[0]: # Create an empty array with np.zeros and assign it to a variable
zeros = np.zeros(100)
# print it
print(zeros)
```

Now try manipulating the arrays using basic math:

```
[0]: # Add the numbers array to itself
numbers + numbers
```

```
2,
                                                                            24,
[0]: array([ 0,
                             6,
                                      10,
                                            12,
                        4,
                                  8,
                                                 14,
                                                      16,
                                                            18,
                                                                 20,
                                                                      22,
            26,
                 28,
                      30,
                            32,
                                 34,
                                      36,
                                            38,
                                                 40,
                                                      42,
                                                            44,
                                                                 46,
                                                                      48,
                                                                            50,
                                 60,
                                      62,
                                            64,
                                                 66,
                                                      68,
                                                            70,
                                                                 72,

                                                  289,
                                                        324,
                                                               361,
            121,
                                                                     400,
                                                                           441,
                  529,
                         576,
                               625,
                                      676,
                                            729,
                                                  784,
                                                        841,
                                                               900,
           1089, 1156, 1225, 1296, 1369, 1444, 1521, 1600, 1681, 1764, 1849,
           1936, 2025, 2116, 2209, 2304, 2401, 2500, 2601, 2704, 2809, 2916,
           3025, 3136, 3249, 3364, 3481, 3600, 3721, 3844, 3969, 4096, 4225,
           4356, 4489, 4624, 4761, 4900, 5041, 5184, 5329, 5476, 5625, 5776,
           5929, 6084, 6241, 6400, 6561, 6724, 6889, 7056, 7225, 7396, 7569,
           7744, 7921, 8100, 8281, 8464, 8649, 8836, 9025, 9216, 9409, 9604,
```

Note that when you perform a math operation on an array, it will often perform that operation on each item in that array. It's convenient that we don't have to loop through all the values to apply the math operation to every item in the array.

You can find information about the size of an array by using .shape. Note that .shape is an **attribute** of array -- a special variable that belongs to every *array object*. Try it out:

HINT: Because . shape is not a function you don't need to use parentheses.

```
[0]: # Use shape to view the size of your array numbers.shape
```

[0]: (100,)

9801])

. shape gave us just one number, because our array has only 1 dimension. Later we'll see what it looks like for arrays with more than 1 dimension.

Numpy also allows you to create 2D arrays, like with lists. We can use the method called reshape to change an 1-dimensional array into a 2-dimensional array. reshape takes two arguments: the number of rows and the number of columns. Try turning one of your arrays into a 2D array using reshape.

[20, 21, 22, 23, 24, 25, 26, 27, 28, 29], [30, 31, 32, 33, 34, 35, 36, 37, 38, 39], [40, 41, 42, 43, 44, 45, 46, 47, 48, 49], [50, 51, 52, 53, 54, 55, 56, 57, 58, 59],

```
[60, 61, 62, 63, 64, 65, 66, 67, 68, 69], [70, 71, 72, 73, 74, 75, 76, 77, 78, 79], [80, 81, 82, 83, 84, 85, 86, 87, 88, 89], [90, 91, 92, 93, 94, 95, 96, 97, 98, 99]])
```

Now the .shape of your array should be changed, try printing it out below:

```
[0]: # Print the shape of your new array numbers_2d.shape
```

[0]: (10, 10)

Now we will try a couple of numpy's math functions!

```
[0]: # try using np.sum to add the items in a list together print(np.sum(numbers))
```

4950

```
[0]: # try squaring the value of each item in your array print(numbers**2)
```

```

9604 9801]
```

Try converting the numbers array to an array of floats using the method called astype:

```
[0]: # Convert the array into an array of floats
print(numbers.astype(float))
```

```
[ 0. 1. 2. 3. 4. 5. 6. 7. 8. 9. 10. 11. 12. 13. 14. 15. 16. 17. 18. 19. 20. 21. 22. 23. 24. 25. 26. 27. 28. 29. 30. 31. 32. 33. 34. 35. 36. 37. 38. 39. 40. 41. 42. 43. 44. 45. 46. 47. 48. 49. 50. 51. 52. 53. 54. 55. 56. 57. 58. 59. 60. 61. 62. 63. 64. 65. 66. 67. 68. 69. 70. 71. 72. 73. 74. 75. 76. 77. 78. 79. 80. 81. 82. 83. 84. 85. 86. 87. 88. 89. 90. 91. 92. 93. 94. 95. 96. 97. 98. 99.]
```

Nice job! You just practiced:

- Using numpy to perform array operations.
- Performing math with numpy.
